COVID-19 Data Analysis Report

1. Introduction

The COVID-19 pandemic had a significant impact worldwide. Analyzing COVID-19 data helps understand the spread of the virus, vaccination progress, and relationships between cases and deaths.

This project analyzes COVID-19 data using Python, Pandas, Matplotlib, and Seaborn to extract insights and visualize trends, focusing mainly on India.

2. Objective

The main objectives of this project are:

- To analyze COVID-19 cases and deaths
- To study vaccination progress in India
- To identify relationships between cases and deaths
- To visualize trends using graphs

3. Tools and Technologies Used

- Python
- Pandas
- NumPy
- Matplotlib
- Seaborn
- Jupyter Notebook

4. Dataset Overview

The dataset contains global COVID-19 data with **67 columns**, including:

Column	Description
Location	Country name
Date	Date of record
Total_cases	Total Confirmed Cases
New_cases	Daily new cases
Total_deaths	Total Deaths
New_deaths	Daily deaths
Total_vaccinations	Total vaccinations

For this analysis, **India's data** was extracted for focused study.

5. Data Cleaning and Preprocessing

Steps Performed:

1. **Selected India data:**
   india = df[df["location"] == "India"]

2. **Converted date column:**
   india["date"] = pd.to_datetime(india["date"])

3. **Handled missing values:**
   india.fillna(method='ffill', inplace=True)

   Why ffill?
   Because COVID data is time-series, forward fill helps maintain continuit

6. Data Analysis and Visualization

6.1 Vaccination Progress in India

```
plt.figure(figsize=(10,5))
plt.plot(india['date'], india['total_vaccinations'])

plt.title("Vaccination Progress in India")
plt.xlabel("Date")
plt.ylabel("Total Vaccinations")

plt.show()
```

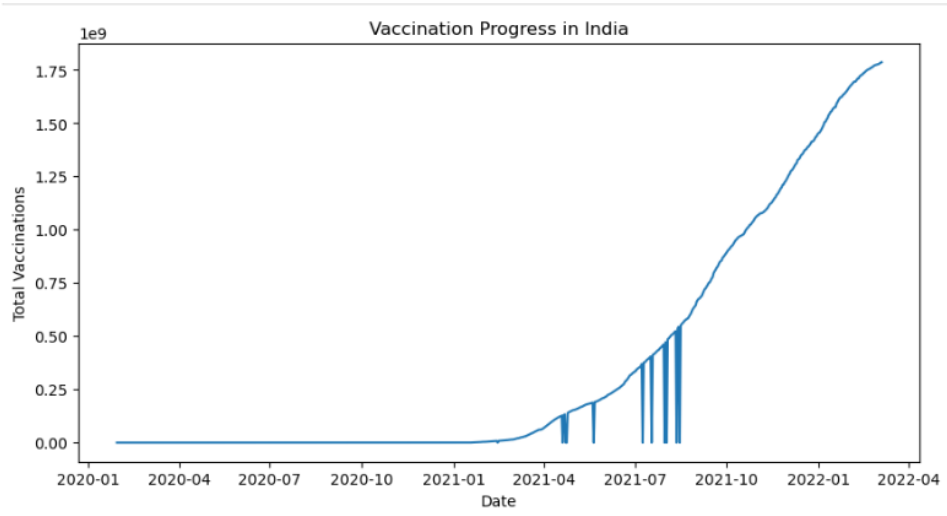

Figure 1: Vaccination Progress in India

Interpretation:
The graph shows a steady increase in vaccinations over time, indicating successful vaccination campaigns.

6.2 Correlation Analysis

```
corr = india[['total_cases','new_cases','total_deaths','new_deaths']].corr()
print(corr)
```

Correlation Results

Variable Relationship	Value
Total Cases vs Total Deaths	0.995 (Very Strong Positive)
New Cases vs New Deaths	0.748 (Strong Positive)
Total Cases vs New Cases	0.222(Weak Positive)

6.3 Heatmap Visualization

```
sns.heatmap(corr, annot=True, cmap="coolwarm")

plt.title("COVID Data Correlation")

plt.show()
```

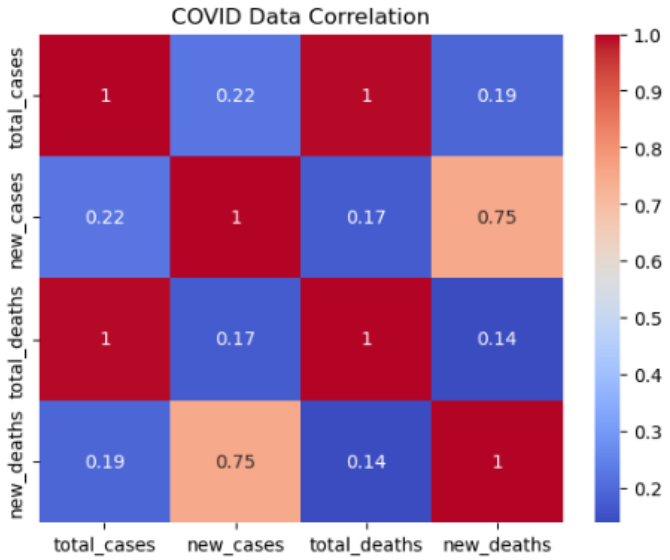

Figure 2: COVID Correlation Heatmap

7. Interpretation of Results

- **Total cases and total deaths are highly correlated (0.995)**
  → As cases increase, deaths also increase
- **New cases and new deaths show strong correlation (0.748)**
  → Daily rise in cases impacts daily deaths
- Vaccination trend shows **continuous growth over time**

8. Key Insights

- COVID spread directly impacts death rate
- Vaccination increased steadily, helping control the pandemic
- Daily case spikes influence daily death rates
- Strong correlations help in predicting future trends

9. Conclusion

This project analyzed COVID-19 data focusing on India. The analysis revealed strong relationships between cases and deaths and showed significant progress in vaccination efforts.

- Such analysis is useful for:
- Government policy decisions
- Healthcare planning
- Pandemic response strategies

10. Future Improvements

- Use machine learning for case prediction
- Compare multiple countries
- Perform time-series forecasting
- Build dashboards using Power BI
